

## PRODUCT INSTRUCTIONS

Product Code	<b>82U</b>	Product Description	<b>15mm Tank Connector Fitting Tool</b>
Product Code	<b>83X</b>	Product Description	<b>22mm Tank Connector Fitting Tool</b>

These tools have been designed to make the job of fitting a 15mm or 22mm Tank Connector easy. Traditionally the task of fitting a connector to a domestic cold water tank has been awkward and required 2 pairs of hands or very long arms. The tools engage with the dog drive of the tank connector and can then be used one handed whilst the nut of the tank connector is tightened.

Patent Applied For.

- After cutting a hole into the tank (to the connector manufacturers requirements), place the tank connector tool (with T/bar removed) through the centre of the connector.
- Insert the connector and tool through the hole in the tank, ensuring the seal supplied with the connector is in place.
- From the outside of the tank fit the seal and flange nut over the tool and replace the T/bar.
- Whilst holding the tool on the T/bar ensure the slots are engaged on the inner flange dog drives and tighten the flange nut onto the seal using a conventional spanner or wrench.
- Remove the T/bar from the tool and retrieve the tool from this inside of the tank.
